

Brief Report for Project 5

My project uses Brackets for the HTML file and used Visual Studio 2 for the CSS, JS, and PHP files. I used Google Chrome for my page to be tested on. I also just updated my files in the LAMP server in order to have the PHP work and be tested on. At first this project seemed challenging. I then found a video online demonstrating how to incorporate the PHP into the html. Once I figured out how to make the conversions for the temperature conversions I implemented the same technique for the other types of conversions. I also tried to make this project visually pleasing like the project 3 it was modeled off. This only further improved my skills with CSS. PHP is such a useful language and I am enticed to use it on future projects and would have been useful in past one. There was one problem I had in the past projects that would have been easily solved using PHP. I tried making all my code as clean as possible and I think I accomplished that. This task was probably just as consuming as the last. I feel like I can always do more from a visual stand point but the basic requirements always seem to take

me the same amount of time. W3 provided me the least amount of help this time. Once I figured out how to do that first conversion I basically just trial and error'd the rest of my learning for the project.
