

## Brief Report for Project 6

My project uses Brackets for the HTML file and used Visual Studio 2 for the CSS, JS, and PHP files. This was a very interesting project. It was definitely the most challenging. It was one that I wish I had more time to complete. But in the end I used many online resources that helped me through how to work with phpmyadmin. Though I have worked with it before in other classes. Implementing certain aspects of this project were challenging due to my over thinking and need to want to make it do more than maybe it was required. I enjoy learning how to use these type of skills due to the idea that this is how most of the internet works and is part of our daily lives. I found many good videos on YouTube explaining certain steps I wanted to implement. The most challenging part was simply trying to get the users submission to be read into the phpmyadmin. This took time but in the end was figured out. Once I settled this I made the touches I tent to do for these projects and tried playing with the concept to add in more features.
