Brief Report for Project 3

My project uses Brackets for the HTML file and used Visual Studio 2 for the CSS file. I used Google Chrome for my page to be tested on. This was because I am most familiar with it and use it as my default browser for other daily tasks. I did a lot of research for this project. I tried implanting more unique and complex attributes but in the end did not have the time for most of these ideas. I simply needed hands on assistance. I had a problem with finding out how to pass multiple input vales from a selector wheel to the JavaScript. I once again used the website www.w3schools.com, they offer many great tips on trying to put ideas into action. But mainly just used my knowledge from a prior class to work this JavaScript project. I really tried to mess with the CSS file to change the appearance, much more than I normally would. I also learned the formatting a little bit better, understanding when to cut off an attribute and reading the code more efficiently. I used temp.js as my personal JavaScript file, and sb-admin.ccs contains my CCS work under the commented out star line(/****…./).
